

Web Application Development Presentation 2

Alex, Jaclyn, Lucy

Development Challenges

Jaclyn:

- Translating my Figma mockups into responsive CSS
- Styling around HTML that I did not create
- Matching my CSS selectors to the existing HTML classes
- Adjusted the layout for mobile and desktop across all three screens
- Made minor HTML cleanup so the styling worked correctly:
 - Replaced the original svg/text logo setup with our PNG logo
 - Removed extra font links so the CSS controlled the typography

Development Challenges

Lucy:

- Transferring a Figma design into an HTML file
- Creating HTML files without any design
 - I had to do some basic CSS and then delete it
- Deciding how to handle the quote images on the results page since it would be empty until the API filled it in
- Figuring out where to leave clear comments in the HTML so that Jaclyn and Alex knew exactly where to put in their own work.

Development Challenges

Alex:

- Data transfer between separate pages
- Excessive string formatting
- Working with react with little experience
- API Usage

Unfinished or Wishlist Features

- Proper mobile support
- Server-Client separation
- Separation of ran code from page code
- Scores page
- Difficulty
- Make the site more functional by completing all navigation links and pages, including the mobile hamburger menu

Team Reflection

- Each part of the app depended on the others, so the structure, styling, and programming all had to work together
- Since we worked on different sections, communication and commenting were important to make sure everything connected smoothly
- Testing in the browser helped us catch layout and functionality issues along the way
- The project showed us how much planning and teamwork goes into building a multi-screen web app

How to Run

- Download the application from the submission
- cd into the application and run npm install
- Open <https://api.quotable.io/quotes/random> in a separate tab and allow it to run
- Run the application via “npm start”
- API keys are mine, only have a limited number of images that can be gathered
